

Nearly Ten Active Ads Across Three Branches. One Enquiry That Waited Four Days For A Reply.

A read on what happens between an enquiry landing and someone from the team picking it up.

01 What We Looked At

Clinic Next Face runs close to ten active Google Ads across the three branches — under-eye fillers, melasma, pigmentation, dark circles, hyperpigmentation, Q-switch laser — treatments where someone is either ready to book or actively comparing clinics.

Two test enquiries: on WhatsApp, a message sent Friday got no reply — the first follow-up came the following Wednesday, at 12:30pm and again at 2:30pm. On Instagram, an automated reply asked for a contact number and handed off to the team. No human reply followed.

02 What It Shows

Under-eye fillers and melasma aren't the same enquiry. One is someone who already knows what they want and is deciding which branch to book with. The other is checking if the price is even in range before deciding anything at all.

Both currently land in the same place — a WhatsApp thread or an Instagram DM waiting on a human — with nothing in between that tells anyone which one they're looking at.

03 Why It's Expensive

The four-day gap isn't really a response-time problem — it's what happens when the automation captures an enquiry but doesn't sort it. Every message, regardless of how close that person is to booking, gets the same queue and the same follow-up.

And when someone does follow up — Wednesday, twice in one day — it still reads as a person working through a backlog by hand, not a system that already knew who to call first.

So the team's time isn't the real constraint. Not knowing who's worth calling back first is — and the enquiries closest to booking are exactly the ones with the least reason to wait.

04 Worth Asking

Across all three branches this week — of everyone who messaged in about a filler or melasma consult, how would anyone know, before the callback, which of them had already spent three days comparing your prices against another clinic's?

— Tilak, Valence Ops

This is a read on public information and two test enquiries — not clinic data. Happy to be told where it's wrong.
