

PREPARED FOR

Derma Solutions

Answered in under a minute, with everything except an answer.

One question about acne and scarring, one very fast reply, and four links.

OBSERVED – ONE ENQUIRY, MON 10 AUGUST

4:28 PM – enquiry sent → REPLY IN UNDER A MINUTE

“Sure. Please visit our website it’s all mentioned there”

- link to the website
- link to Facebook
- link to Instagram
- link to YouTube

What it didn’t contain: a question about the concern, a treatment, a price, or a time to come in.

A real message to the clinic’s own number, in working hours.

The speed is real and worth protecting. What seems to be missing is anything to send — so the quickest true answer available was a link, which puts the patient back where they started. By then the enquiry has already been paid for.

WHY THIS MATTERS

Someone who messages a clinic on WhatsApp has usually looked at the website already — that is generally where the number came from. Sending them back to it isn’t slow and it isn’t rude. It simply returns them to a point they had already passed.

CONFIRMED FROM OUTSIDE

- ✓ Practo Prime on both listed doctors, with 1,649 patient stories, and no Meta or Google spend at all. The aggregator is the acquisition strategy, and it charges per enquiry.
- ✓ Prime is the tier patients choose when they want a fast, verified reply — which is the expectation the enquiry arrives carrying.

CAN'T CONFIRM WITHOUT YOUR DATA

- Whether anything sendable exists — a treatment summary, a price range, anything that isn’t a link.
- Whether a patient who telephones instead gets asked what they are calling about.

WHAT WE'D CHECK FIRST, IF WE HAD ACCESS

- The last month of enquiries on that number — how many were answered with a link and nothing else.
- Whether the first reply could carry one question instead of four links: what the concern is, or when they could come in.

What we’re not saying: this isn’t about the reply being slow — under a minute is faster than almost anyone manages, and that instinct is worth protecting. Nor is it about the website being poor. It’s that the fastest thing available to send was the thing the patient had most likely already seen.

Speed like that is hard to build and easy to waste. The question is what the person holding the phone actually has to send when a patient asks — and whether, right now, it is anything other than a link.

You can check without us: look at the last month on that number and count the replies that contained a link and nothing else. If it’s worth going through properly, we’d map thirty days **at no cost to the clinic.**
