

PATIENT COMMUNICATIONS · PROPOSAL

# RUA Skin & Hair Center

---

Closing the gap between an enquiry and a seated consultation, and taking the repetitive chasing off your team, so their time goes to the patient in the chair.

01

## Where this picks up

On our call, we walked through what happens to an enquiry once it reaches RUA today: two branches, two WhatsApp numbers, a website, Instagram, and a Google listing for each location, each one a different front door. The information form we sent is the next step. Your answers tell us which of the systems below actually fit, and what the exact cost would be.

This document sets out what we would build once that is confirmed: what each system does, how they connect, how long setup takes, and what it costs. It is not a commitment to build everything at once. The order things get switched on is something we would agree together.

02

## The systems we would build

Seven systems, each closing one specific gap between an enquiry and a completed visit. The first three, Qualification, Booking and No-Show Recovery, are the core of the pipeline. The other four are typically sequenced once those are holding steady. Exact order to be agreed together once your answers to the form are back.

All of them run across the channels enquiries already arrive on: **WhatsApp**, whether the patient comes from the Google listing, an ad, or messages the number directly, **Instagram** and **Messenger**. Messages are built in English by default. Other languages are supported, and confirmed with you before anything is built.

---

### 01 AI Lead Qualification Bot

Answers a new enquiry immediately, on any channel, at any hour, and captures the concern before anyone at the desk has to pick up the phone.

#### WHAT IT DOES

- Instant response to every new enquiry, including outside business hours
- Structured qualification flow: requirement, service, budget range, availability, urgency
- AI-driven handling of general questions while the patient waits for the front desk
- Lead summary generated automatically for the front desk, with full context preserved on handoff
- Does not provide medical or clinical advice. Clinical questions are escalated to a human team member

#### ONGOING

- Qualification flow and questions updated as services or offers change
- Ongoing monitoring of response quality and handoff accuracy

## 02 Booking System

*Optional CRM/Google Sheets and calendar write-integration, depending on what the clinic's system supports*

Turns the outcome of an enquiry into a held appointment instead of a promise to call back.

### WHAT IT DOES

- When a patient is ready to book, the request is sent directly into RUA's CRM/Google Sheets and calendar
- Where the setup supports it, the slot is booked directly. Otherwise it is submitted as a requested slot
- The front desk confirms every booking with the patient before it is treated as final, regardless of path
- Every enquiry is tagged with the source it came from, so a booking can be traced back to the ad, the Google listing, Instagram or a direct message

### ONGOING

- Booking flow adjusted as the CRM/Google Sheets and calendar setup is confirmed
  - Ongoing monitoring of booking completion rates
- 

## 03 No-Show Recovery System

Chases a missed consultation the same day, instead of leaving it to whoever happens to notice.

### WHAT IT DOES

- Pre-appointment confirmation and reminder sequence
- Self-serve reschedule and assistance options
- Automated no-show detection and recovery outreach the same day
- Rebooking into an available slot where a direct booking link allows it, or passed to the front desk to call and confirm the new time

### ONGOING

- Recovery sequence maintained and refined over time
- Ongoing monitoring of reminder and recovery performance

## 04 Quote Follow-Up System

Keeps following up past the first silence, since most quotes are considered decisions, not one-message ones.

### WHAT IT DOES

- Staged, automated follow-up reminders after a quote or treatment plan is shared
- Personalised messaging per quote
- Automatic escalation to the front desk when interest is shown

### ONGOING

- Follow-up sequence maintained and refined as pricing or offers change
  - Ongoing monitoring of follow-up performance
- 

## 05 Voice Reception System

*Optional. Inbound only. Exact call flow and any live booking capability confirmed before build.*

Answers the phone during the hours it usually goes unanswered, after the desk closes and on the days the clinic is shut, instead of ringing out or dropping to voicemail.

### WHAT IT DOES

- Answers every call that arrives when the desk is not open, including Wednesdays
- Asks the same qualifying questions used on the messaging channels: requirement, service, budget range, availability, urgency
- Takes down full details and hands a structured summary to the first person on shift when the clinic reopens, with live booking added once we confirm it can be done reliably over a call
- Escalates anything requiring clinical judgement rather than attempting to answer it
- Inbound only. The system receives calls, it does not place them

### ONGOING

- Call handling reviewed against actual enquiry volume during closed hours, and refined over time

## 06 Review Generation and Reputation Management

Asks for a review at the right moment, from the patients most likely to be glad to leave one.

### WHAT IT DOES

- Automated, well-timed review requests after a successful consultation or completed procedure
- Gentle follow-up reminders where appropriate
- Alerts to the team for feedback that needs attention

### ONGOING

- Review-request timing and messaging refined over time
- Ongoing monitoring of review activity across platforms

## 07 Dead Lead Enquiry Reactivation

*Optional. The real work is the current backlog. Once the systems above are running, there is very little left for this to catch.*

Clears out the enquiries that went cold before any of this was running, and hands any live interest back to the front desk.

### WHAT IT DOES

- Existing cold enquiries reviewed and a reactivation sequence built for the current backlog
- Live interest handed back to the front desk with full context
- This is where nearly all the value sits: clearing what already exists, not something built to run indefinitely

### WHAT IT NEEDS

- A record of past enquiries we can actually read, in a CRM, a sheet, or the message threads themselves
- People who contacted the clinic first, so they can be messaged again within WhatsApp and Meta rules
- Enough of them to be worth building for, which is sized before anything is committed

### ONGOING

- A light periodic check for the occasional enquiry that still slips through, even with the systems above running. Not a standing system, just an occasional pass

03

## How it works together

These systems are built to connect into one pipeline, so no enquiry falls through a gap between stages.

- **A lead qualified by the bot** books directly into a held slot through the Booking System, or is passed to the front desk to confirm one.
- **A call that arrives when the desk is closed** is answered by Voice Reception, and reaches the front desk as the same structured summary a message would.
- **A booked appointment** flows into No-Show Recovery if the patient does not show up.
- **A completed visit** flows into Review Generation.
- **A lead that goes quiet at any stage** becomes a candidate for Reactivation later, rather than simply disappearing.

Your team does not need to learn a new system. They keep working the way they already do, responding when a patient replies, while the infrastructure behind each stage runs in the background. The one thing they add is marking down what happens offline, so the record matches what actually happened.

04

## How we would deliver it

The shape below is general. Exact scope and sequencing get finalised once your answers to the form are back. **From onboarding, the systems in scope are live and running within four weeks.**

---

### 01 The information form

Already with you. Your answers confirm the booking setup, how enquiries should route, and which of the systems above are worth building.

---

### 02 Exact systems and costs

We come back with the precise set of systems for RUA and one fixed quotation. Nothing is charged before you have seen it.

---

### 03 Audit and access

If you decide to go ahead, this runs before anything is built, at no cost to the clinic: how enquiries have actually been handled across every channel, over the past two weeks or more. Access to the CRM/Google Sheets, calendar and messaging accounts is confirmed alongside it.

---

### 04 Build, test and go live

Each system is configured against RUA's actual services, pricing and messaging style, then tested against real cases and the edge cases that break automations. Systems go live in the agreed order, one at a time rather than all at once.

---

### 05 Monitor and refine

We watch how patients respond in the first stretch after launch and adjust messaging, timing, and flows accordingly.

---

05

## Why Valence Ops

- **Managed infrastructure, not a self-serve tool.** Your team never has to learn a new system.
- **Built specifically for clinical communication:** compliant messaging, patient privacy, and regulatory norms in mind.
- **Every system is designed around how RUA actually operates,** not a generic template.
- **Your team keeps working the way they already do, with one small addition.** When something happens offline, a walk-in, a phone booking, a confirmation at the desk, they mark it down so the record matches reality. We handle everything around that.

06

## Estimated investment

Based on our current understanding, the complete system described in this proposal is estimated as follows. These are preliminary estimates, not a quotation.

|                                         |                      |
|-----------------------------------------|----------------------|
| Implementation and build                | ₹65,000 to ₹1,00,000 |
|                                         | ONE TIME             |
| Ongoing operation and optimisation      | ₹25,000 to ₹45,000   |
|                                         | PER MONTH            |
| ALL FIGURES EXCLUSIVE OF APPLICABLE GST |                      |

**The range reflects the final set of systems built for RUA, not uncertainty about the intended outcome.** Where RUA’s booking sits, how many channels feed in, and how enquiries route between Ramamurthy Nagar and Indiranagar all move the figure inside that band. The exact estimate is calculated once we know which systems are being built, based on the information filled in through the form already sent.

**The ongoing operating cost depends on the same thing.** It varies with the systems being run and the maintenance and optimisation each one needs to keep working well.

After the form is filled in and the technical discovery is complete, we will issue one fixed quotation before any paid build begins.

**The operating fee begins when the first production system goes live.** Any materially different CRM/Google Sheets, booking or integration requirement will be identified and agreed before the affected work proceeds.

07

## What the system runs on

The system uses RUA’s Meta and WhatsApp infrastructure, Sarvam-powered language, qualification and voice, Exotel for inbound calls, and a managed application layer on Supabase and Hostinger. The connection to RUA’s existing CRM/Google Sheets and booking environment is confirmed during technical discovery.

| COMPONENT                                     | ROLE                                                                                         | COMMERCIAL TREATMENT                  |
|-----------------------------------------------|----------------------------------------------------------------------------------------------|---------------------------------------|
| Meta and WhatsApp                             | Enquiry messaging and channel intake                                                         | Variable, billed to RUA               |
| Sarvam API                                    | Language and qualification support, and inbound voice if the Voice Reception System is built | Variable, billed to RUA               |
| Exotel                                        | Inbound call handling for the Voice Reception System                                         | Variable, billed to RUA               |
| Supabase                                      | Application data, workflow state, logs and reporting                                         | Included in the operating fee         |
| Hostinger                                     | Hosting and deployment                                                                       | Included in the operating fee         |
| Existing CRM/Google Sheets and booking system | Client records, availability and appointment handling                                        | RUA’s existing setup, to be confirmed |

## Infrastructure, and what is included

|                          |                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>BASELINE</b>          | Supabase is currently estimated at approximately <b>₹2,800 a month</b> and Hostinger at approximately <b>₹2,500 a month</b> , around <b>₹5,300 combined</b> .                                                                                                                                                                                |
| <b>HOW IT IS CHARGED</b> | That baseline sits inside the ongoing operating fee. It is not a separate third-party add-on. Provisioning and configuration are covered within the implementation fee. A major infrastructure upgrade, an additional project, or a materially higher storage, compute or hosting requirement is approved separately, before it is incurred. |

Message and language usage

Meta and Sarvam charges are variable and depend on how much the clinic actually sends. They are either billed directly to RUA or passed through at actual cost. For planning only, at current published rates:

| INTERACTIONS PER MONTH | META   | SARVAM | COMBINED |
|------------------------|--------|--------|----------|
| 100                    | ₹11.50 | ₹6.59  | ₹18      |
| 1,000                  | ₹115   | ₹66    | ₹181     |
| 10,000                 | ₹1,150 | ₹659   | ₹1,809   |

Assumes ₹0.115 per Meta message, and Sarvam-105B at ₹29.28 per million input tokens and ₹73.20 per million output tokens, against a maximum of 1,500 input and 300 output tokens per interaction. Figures are before applicable vendor taxes.

These are indicative planning figures, not a guaranteed blended per-message rate. Actual charges depend on Meta message category, templates, platform rules, token length, retries and the final workflow design. Meta’s own pricing structure changes on 1 October 2026, which affects service and in-window utility messages. The rates above are the current ones.

07 · CONTINUED

Voice reception usage

If the Voice Reception System is built, it adds two variable costs on the same basis. **Exotel is the telephony provider**, the phone line the call actually arrives on. **Sarvam is the model provider** behind the voice agent, and runs on top of Exotel through their existing integration. For planning only, at current published rates:

| INBOUND VOICE USAGE | SARVAM VOICE | EXOTEL         | COMBINED         |
|---------------------|--------------|----------------|------------------|
| Per minute          | ₹3.50        | ₹0.30 to ₹0.50 | ₹3.80 to ₹4.00   |
| 100 minutes a month | ₹350         | ₹30 to ₹50     | ₹380 to ₹400     |
| 500 minutes a month | ₹1,750       | ₹150 to ₹250   | ₹1,900 to ₹2,000 |

Assumes the Sarvam Voice Agent at ₹3.50 per minute, covering the voice agent stack, evaluation and analytics, and Exotel inbound telephony at ₹0.30 to ₹0.50 per minute. Figures are before applicable vendor taxes. **These totals are built from each vendor’s published rates, not a single combined quote**, and are confirmed once the call flow is scoped.

What we would like to do next

Once your answers to the form are back, we can put an exact set of systems in front of you: **what catches every enquiry, what runs the follow-ups and reminders, and what rebooks the patients who do not turn up**. That takes the repetitive work off your team and leaves them with the patients in front of them.

That comes back to you as a precise proposal with **one fixed quotation. Nothing is charged before you have seen it**.

If you decide to go ahead, **the enquiry audit runs first, at no cost to the clinic**, so the build starts from what is actually happening rather than what we assume.

From there, you decide what is worth doing, and if it makes sense on both sides, we start building.
