

PREPARED FOR

Dr. Swetha's Cosmoderm Centre

The ad brings them in. Nothing catches them when the desk is busy.

We tested Dr. Swetha's WhatsApp and Instagram last week with a real enquiry on both. What we found says less about how busy the front desk gets, and more about what happens to an enquiry the moment it is.

OBSERVED – WHATSAPP & INSTAGRAM ENQUIRY

WHATSAPP Asked about treatment information – no automated reply, no question
REAL ENQUIRY SENT about what was needed.

INSTAGRAM Asked for treatment information – the same result: no automated
SAME WEEK, SAME TEST reply, no qualifying question.

Both were real messages sent to the clinic's own channels – not a guess. Neither got a reply until the front desk was free to notice and answer manually.

One slow channel could be a fluke. Two different channels, tested the same week, with the exact same gap – no automation, no question asked – isn't a fluke. It's what happens to every enquiry the moment the front desk is with someone else.

WHY THIS MATTERS

Dr. Swetha's has been running a paid ad since July 6th, pointed at skin and hair consultations – every person who clicks it already cost something to reach. Right now, whether that enquiry lands on WhatsApp or Instagram, nothing happens to it until someone at the front desk is free to notice and reply by hand. If that moment is a call, or a patient in the chair, the enquiry just waits – and the clinic's own reviews already describe exactly that: appointment coordination issues, long waits, and communication gaps after the first contact. The ad is doing its job. What happens in the minutes right after is where the spend is at risk.

CONFIRMED FROM OUTSIDE

- ✓ A paid Meta ad has been running since July 6, 2026, across Facebook and Instagram, promoting skin and hair consultations.
- ✓ A WhatsApp enquiry asking about treatment information received no automated reply and no qualifying question – the same result on Instagram, tested the same week.
- ✓ Reviews repeatedly mention appointment coordination issues, waiting time, and communication gaps after the first contact.

CAN'T CONFIRM WITHOUT YOUR DATA

- How long an enquiry typically waits before the front desk notices and replies manually.
- How many enquiries during busy hours go unanswered long enough that the person messages another clinic first.

WHAT WE'D CHECK FIRST, IF WE HAD ACCESS

- How many enquiries land on WhatsApp and Instagram in a typical week, and how much of that arrives while the front desk is already with someone.
- Whether an instant reply that asks what the person's looking for – skin, hair, which concern – would let the coordinators pick up an enquiry already knowing who they're talking to.

What we're not saying: this isn't about the front desk team – they're clearly trusted and well-liked, per the reviews. It's not about changing how they talk to patients either. This is only about what happens to an enquiry in the minutes before anyone's free to look at it.

This isn't unique to Dr. Swetha's – it's what happens to almost every clinic that pairs real ad spend with a front desk that's genuinely busy with people in the room. The real question isn't whether the team eventually replies; it's how many of the enquiries that ad already paid for went quiet in the meantime, and had already messaged the next clinic by the time anyone got back to them.

A full audit – mapping exactly how enquiries could be caught the instant they land, on both channels – takes about 30 minutes, **at no cost to the clinic.**
