

ENQUIRY AND APPOINTMENT SYSTEMS · PROPOSAL

# Aurilueur Esthetic Clinic

---

What we would build, how it works with your team, and what it costs.

01

## Where this picks up

This follows our meeting at the clinic and the form you filled in afterwards. It covers what we would build, how it works with your team, what it costs, and how we would start.

Aurilueur already handles enquiries well. Nothing here changes how your team works. It removes the repeated work underneath, so the same standard holds at every hour, on every day, and as enquiries grow.

02

## How enquiries are handled today

You told us the aim is to connect with enquiries, and that success would look like more lead conversion.

From the form and our conversation, this is how it runs now.

- Fifteen to twenty enquiries arrive on a normal day, from Google, Meta, your Business Profile, your website and referrals
- Patients message on WhatsApp. Your sales manager handles it
- Appointments are confirmed with a reminder
- A lead who goes quiet is followed up four or more times
- A patient who misses an appointment is called straight away
- When a cancellation frees a slot, patients are contacted where possible
- Each enquiry is entered into your CRM by hand

**That is a lot for three people to carry, and they carry it.** Every step above is done well. Every step above is also done by a person.

03

## What this looks like as the clinic grows

Every step on the previous page needs someone free at the exact moment it needs doing.

On a normal day, that works. On a full day, or when a treatment runs long, or when a case comes in unplanned, the tasks that wait are the ones with nobody sitting in front of you. The reminder. The follow-up. The call to the patient who did not arrive.

That is not a problem with the process. It is what happens when the work grows faster than the hours available to do it. And with more going into advertising, the work grows.

### The choice this creates

At double the enquiries, the same steps still have to happen. Today the only way to do that is to add a fourth person at the front desk, and then a fifth.

**The other option is to take the repeatable work off the three people you already have.** The reminders, the confirmations, the first replies, the chasing, the typing into the CRM. None of it needs judgement. All of it needs doing, every time, without fail.

That is what this proposal is for.

04

## What we would build

Three systems, switched on one at a time.

### 01 Enquiry handling, on every channel

Enquiries reach you in several places. WhatsApp, Instagram, Facebook Messenger and your website form. Each is watched separately today. This brings them into one place.

#### WHAT IT DOES

- Every channel lands in one view, so nothing sits unread in an app nobody opened that day
- Replies to a new enquiry straight away, at any hour, on any day
- Asks what treatment they want, what their concern is, and when they are free
- Sends the booking request to your front desk with the full conversation attached
- Hands over to a person the moment anyone at the desk replies in the thread

#### WHERE IT STOPS

- It does not confirm the appointment. Your rep checks availability and confirms
- It does not share prices and it does not give medical advice. If you later want it to share standard package prices, that is switched on only when you ask for it

### 02 CRM entry and a weekly report

Your CRM fills itself in. Once a week you get one page of numbers nobody had to prepare.

#### WHAT IT DOES

- Writes every enquiry, reply, booking and appointment result into your CRM. No typing
- Records how long each enquiry waited before someone answered
- One weekly page: enquiries received and from where, how fast they were answered, consultations booked, consultations attended

#### WHY IT MATTERS

- You can see conversion week by week instead of estimating it at month end
- Everything is written into your CRM, not held by us. The record stays with Aurilueur

#### WHERE IT STOPS

- How much we can write back depends on what your CRM allows. We check that with you before the build begins

### 03 Reminders, missed appointments and free slots

Every appointment confirmed and reminded. Cancellations known early enough to refill the slot. Missed appointments picked up the same day.

#### WHAT IT DOES

- Confirms the appointment when it is booked, and reminds the patient the day before
- The patient can reply to the reminder. They confirm, or they say they need to move it
- Because they reply, you know about a cancellation while the slot can still be filled
- Marks who has confirmed, and gives the desk a short list each morning of who has not
- When a patient does not arrive, raises a call for your rep the same day
- Where a patient is part-way through a course of treatment, offers them the next available times rather than chasing them
- Keeps a list of patients waiting for an earlier slot, messages them when one frees up, and tells the desk who said yes
- When the day has to be rearranged, sends the messages to everyone affected and collects the replies

#### WHERE IT STOPS

- It does not decide the schedule and it does not book anyone. Your rep picks the times and confirms
- Every sequence has a set number of attempts, then stops

### Not part of this

Two more systems are worth looking at once these three are running and there are numbers to judge them by. Following up on quotes that go quiet, and keeping weight-loss programmes on track between months. Neither is included or priced here.

We would also not manage availability. That changes daily and depends on your doctors, and the decision should stay with your team.

05

## What your team does instead

Nobody at the front desk is replaced. It is worth saying that plainly.

Every appointment you book, including each session inside a treatment course, needs a confirmation sent, a reminder sent, someone checking for a reply, and a note in the CRM. Four small actions, repeated for every appointment, every week.

The system takes all of them. What reaches a person is the exception. The patient who wants to move an appointment. The one who did not arrive. The one taking a slot that opened. Far fewer actions, and each one worth more.

|                          |                                                                                                                                                                                                                                                                  |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FIRST HOUR<br>OF THE DAY | The calls. Anyone still unconfirmed for today. Patients who missed a session. Patients who were quoted a few days ago and have not come back. These are worth the most and are the first to slip when the day gets busy.                                         |
| THROUGH<br>THE DAY       | The patients in front of them. Check-in, payments, keeping doctors and rooms coordinated, and the consultation itself, where someone is deciding on a course of treatment. Your best reviews are about your people being attentive. That is the part to protect. |
| END OF<br>THE DAY        | Tomorrow. Who needs moving, which slots are still open, and anything the system has flagged.                                                                                                                                                                     |

**What stops:** first replies, confirmations, reminders, chasing for a reply, and typing any of it into the CRM.

06

## How we would start

One thing working before the next begins.

### 01 Access and wording

We check where each channel currently lands, connect to your CRM, and agree the wording of every message with you. Nothing goes to a patient that you have not read first.

### 02 Enquiry handling and CRM entry

Systems 01 and 02 together. We start with one channel and add the rest once it is steady. Your first weekly report follows soon after.

### 03 Reminders, missed appointments and slots

System 03 follows once appointments are recording properly, because it depends on them. From the day we have access, expect three to four weeks to the first system going live.

## How your team works with it

**Anyone can take over a conversation at any time.** Replying in a thread stops the system on that patient straight away. No double messages, nothing to switch off first.

**It asks before doing anything that matters.** Booking requests come to your desk to confirm. It only sends on its own where a mistake would be harmless.

**It runs inside the tools you already use,** WhatsApp and your CRM. Nothing new to log into. If a connection ever drops, a person is told rather than the enquiry going quiet.

07

## What it costs

**Build and setup, all three systems**

LISTED ₹90,000 · FOUNDING CLIENT WAIVER -₹50,000

**₹40,000**

ONE TIME

**Running the systems**

FROM THE MONTH THE FIRST SYSTEM GOES LIVE

**₹18,000**

PER MONTH

BOTH EXCLUSIVE OF GST AND OTHER APPLICABLE TAXES

The monthly fee is for running the systems, not maintaining software. It covers operating them daily, changing the wording and flows as your treatments and offers change, and your weekly report.

### Platform and usage charges

Two charges sit outside our fee. They are billed by the providers to the clinic directly, on accounts opened in your name, so you see exactly what is used and the cost rises only with your own enquiry volume.

| CHARGE                                              | WHO PAYS       | AT YOUR VOLUME           |
|-----------------------------------------------------|----------------|--------------------------|
| WhatsApp Business API<br>META, PER MESSAGE SENT     | Clinic, direct | Under ₹1,500 a month     |
| Conversational AI usage<br>PER CONVERSATION HANDLED | Clinic, direct | ₹2,000 to ₹6,500 a month |
| Messaging platform, hosting, monitoring             | Us             | Inside the monthly fee   |

**These two figures are not fixed.** They are estimated at fifteen to twenty enquiries a day on rates published today. Both move directly with how many enquiries you receive, so a busier month costs more and a quieter one costs less. Meta and the AI providers also revise their pricing from time to time. Because the accounts are in your name, you see the actual usage and the actual charge each month rather than an estimate from us.

**What this assumes:** that your WhatsApp line can sit on the official WhatsApp Business platform, that we are given access to your Meta business accounts for Instagram and Messenger, that your CRM allows us to read and write to it, and that appointments, attendance and where a patient is in a course of treatment are recorded somewhere the system can read. We confirm each of these with you before the build begins, and show you what changes if any of them turns out differently. Full scope and terms would be set out separately before anything starts. Valid until 30 September 2026.

08

## What we would like to do next

Before you decide anything, try the part you can try.

The WhatsApp side of system 01 is already built and running. We will send you a number. Message it the way a patient would, at whatever hour suits you, and see what comes back. That will tell you more than anything we can write here. Instagram, Messenger and your website form connect into the same system during the build.

The reminder and missed-appointment work cannot be shown that way. It needs real appointments to mean anything, and setting up a fake one would not tell you much. We would rather say so than have you find out.

## Two things we would like to understand

- When you mentioned no-shows, are those mostly patients missing a first consultation, or patients missing sessions during a course of treatment?
- The thirty to forty per cent you mentioned, is that enquiries that book a consultation, or enquiries that go on to treatment?

Both answers change what we build first and what your weekly report measures. We would cover them on the call below.

### The next step

**A meeting online.** We would walk you through how onboarding works, what we would need from your team and when, the order the three systems go live in, and what actually changes at the front desk in the first two weeks. You would end it knowing exactly what the first month looks like.

We would suggest doing this in the coming week, so a start date lands while this season's enquiries are still live.

**Send us two days that work for you and we will confirm one.**
