

A Revenue Diagnostic for DNA Skin Clinic

We sent DNA Skin Clinic two enquiries, on two different channels, the same night. What happened next says less about either message — and more about the system standing behind both of them.

OBSERVED — INSTAGRAM ENQUIRY

10:57 PM

Message sent to DNA Skin Clinic's Instagram, asking for more information about services.

37 HRS 3 MIN, AND STILL UNTENDED AT LAST CHECK

12:00 PM Monday, follow-up check

Still no reply on record. No automated acknowledgment was ever triggered.

This was a real message sent to DNA Skin Clinic's own Instagram — not a guess. A second enquiry, sent to WhatsApp thirty-seven minutes later, was in the same unanswered state at the same check-in.

A single test can't tell us how often this happens — across two channels, two branches, or a typical week. What it does tell us: right now, there's no way for anyone at DNA — including Dr. Priyanka — to know either way.

WHY THIS MATTERS

DNA's enquiry volume is unusually high, driven largely by one person's reach — a real strength. But it can also make that same person the bottleneck when demand needs a human on the other end. A gap like this never shows up in a report. The enquiry just goes quiet, and the person who sent it never becomes a patient.

CONFIRMED FROM OUTSIDE

- ✓ DNA is actively running paid ads on Meta and Google, on top of a large organic following — new enquiries are arriving regularly.
- ✓ The same night, two separate enquiries — one on Instagram, one on WhatsApp — both sat unanswered at the Monday check-in, nothing automated in between.

CAN'T CONFIRM WITHOUT YOUR DATA

- Whether this was a one-off night, or a pattern that repeats most weekends — and how many enquiries a month that adds up to.
- Whether an enquiry that goes quiet for a day still converts later anyway, or is gone for good the moment it stops getting attention.

WHAT WE'D CHECK FIRST, IF WE HAD ACCESS

- How enquiries from Instagram and WhatsApp are logged today, and who's responsible for either inbox after hours.
- Whether an enquiry gets routed differently by branch or treatment, or whether that call is being made ad hoc, in the moment.

WHAT WE'RE NOT SAYING

This isn't about changing how your team talks to patients, or putting a bot between DNA and the people who trust it. That trust is real — it's exactly why the volume exists in the first place. This is only about whether anyone would notice if a message like this went quiet again next weekend.

The real question isn't whether DNA lost these two enquiries — it's how many nights like this one have already happened, across two branches and two channels, with no record anywhere. Worth finding out together?
