

PREPARED FOR

The Glow Clinic

The reply is fast. The system behind it isn't.

We tested WhatsApp at The Glow Clinic last week. What we found says less about how fast someone replied, and more about how much of that reply is riding on one person.

OBSERVED – WHATSAPP ENQUIRY

ENQUIRY SENT

SAME AS A REAL PATIENT WOULD

A WhatsApp message was sent asking about treatments – the same way someone lands here after clicking one of the clinic's ads.

UNDER 5 MINUTES

HUMAN, NOT AUTOMATED

A real person replied quickly – with the same opening question every enquiry gets: "what treatment are you looking for?"

This was a real message sent to the clinic's own WhatsApp number – not a guess.

The reply speed isn't the gap – it's genuinely good. The gap is that the same person typing that same first question is the ceiling on how many of these enquiries can move past it.

WHY THIS MATTERS

The Glow Clinic runs 25 active Google ads across three cities, all pointed at booking a consultation. Every one of those enquiries lands on the same WhatsApp thread, answered by a person typing the same opening line by hand. At low volume, that's not a problem. At the volume 25 ads across three cities are built to produce, that same typing speed becomes a ceiling – and the clinic's own reviews already mention appointment waiting time and scheduling delays, the kind of symptom that shows up downstream of exactly this sort of bottleneck.

CONFIRMED FROM OUTSIDE

- ✓ 25 active Google ads are running across Bengaluru, Hyderabad, and Chennai, promoting consultation booking, skin tightening, facials, and clinical treatments.
- ✓ A WhatsApp enquiry received a human reply in under 5 minutes – with the same opening qualifying question every enquiry receives, regardless of which ad or treatment brought them in.
- ✓ Reviews repeatedly mention appointment waiting time and scheduling delays as a recurring theme, alongside strong praise for the doctors and treatment quality.

CAN'T CONFIRM WITHOUT YOUR DATA

- Whether one person handles WhatsApp enquiries across all three cities, or if it's split by location.
- Whether the delays reviewers mention start at the enquiry stage, or later in the booking process.

WHAT WE'D CHECK FIRST, IF WE HAD ACCESS

- How many enquiries land per day across all three cities, and how much of that volume is one person typing through by hand.
- Whether a faster way to capture treatment, city, and urgency upfront would free up time for the conversations that actually convert.

What we're not saying: this isn't about the WhatsApp reply being slow – five minutes, from a real person, is genuinely good. It's not about replacing that person either. This is only about whether their typing speed should be the ceiling on how many of the people those 25 ads bring in actually reach a booked consultation.

This isn't unique to The Glow Clinic – it's one of the most common patterns we see in clinics whose paid acquisition has outgrown their manual response capacity. The real question isn't whether WhatsApp is fast enough; it's how many of the people 25 ads bring in every day get the same typed reply as everyone else, before anyone finds out how close they actually were to booking.

A full audit – mapping exactly how much of that enquiry volume is manual, and where it's costing booked consults – takes about 30 minutes, **at no cost to the clinic.**
