

PREPARED FOR

Dr. Juvita Aesthetics

The follow-up never stops. The first question never gets asked.

We tested Dr. Juvita's WhatsApp last week. What we found says less about whether anyone follows up, and more about whether anyone ever finds out what the enquiry was for.

OBSERVED – WHATSAPP ENQUIRY

- **INSTANT** — an automated reply: "Thank you for contacting Dr Juvita Aesthetics! Please let us know how we can help you."
- **MID-MORNING** — a real person called and texted, following up on the same enquiry.
- **SAME DAY** — a second follow-up, on the same enquiry.
- **NEXT EVENING** — a third follow-up, still on the same enquiry.

Four touches on one enquiry — and not one of them asked what it was for. This was a real message sent to the clinic's own WhatsApp number, not a guess.

Four touches on one enquiry is real effort — that's not the gap. The gap is that none of those four moments ever asked what the enquiry was for, so every follow-up after the first repeats the same guess instead of moving the conversation forward.

WHY THIS MATTERS

Dr. Juvita runs no ads at all — every one of these enquiries already chose her by name, through reviews and reputation, before typing a word. Her team clearly doesn't let enquiries go cold: four touches on one message is more follow-up than most clinics manage. But none of those touches ask what the person actually wants, so the same generic check-in repeats up to three times whether the enquiry was a serious consult or someone comparing prices. That effort comes out of one doctor's day — her reviews already mention feeling rushed before deciding, and a clinic that depends entirely on one doctor's time can least afford to spend it chasing everyone the same way, regardless of what they actually need.

CONFIRMED FROM OUTSIDE

- ✓ Dr. Juvita runs no active ads — growth comes from organic Instagram, Google search, word of mouth, and existing reputation.
- ✓ A WhatsApp enquiry received an instant automated reply, then three separate human follow-ups over three days — real, persistent effort, with no qualification question asked at any point.
- ✓ Reviews repeatedly mention feeling rushed or pushed toward treatments before deciding, alongside a recurring note that the entire clinic depends on one single doctor.

CAN'T CONFIRM WITHOUT YOUR DATA

- Whether this four-touch pattern happens for every enquiry, or only some.
- How many of those follow-ups go to people seriously considering a consult versus people just checking prices.

WHAT WE'D CHECK FIRST, IF WE HAD ACCESS

- How many WhatsApp enquiries come in per week, and how many get the full four-touch sequence without ever being asked what they wanted.
- Whether one question at the very first reply — what treatment, how soon — would let the same follow-up effort go only to the enquiries worth chasing.

What we're not saying: this isn't about the team not following up — four touches on one enquiry is more effort than most clinics put in, and it should stay exactly that persistent. This isn't about needing more of anything either, ads, content, or automation for its own sake. This is only about whether that effort is aimed at the right enquiries before it's spent.

This isn't unique to Dr. Juvita's clinic — it's what happens when a good habit, persistent follow-up, never got paired with a first question. The real question isn't whether the team follows up enough; it's how many of those four-touch sequences are spent on someone who was never going to book, in a clinic where the one person who can't be duplicated is the doctor herself.

A full audit — mapping exactly which enquiries get the full follow-up sequence, and which ones a single question upfront would have sorted — takes about 30 minutes, **at no cost to the clinic.**
